

CLASS TEST - 2

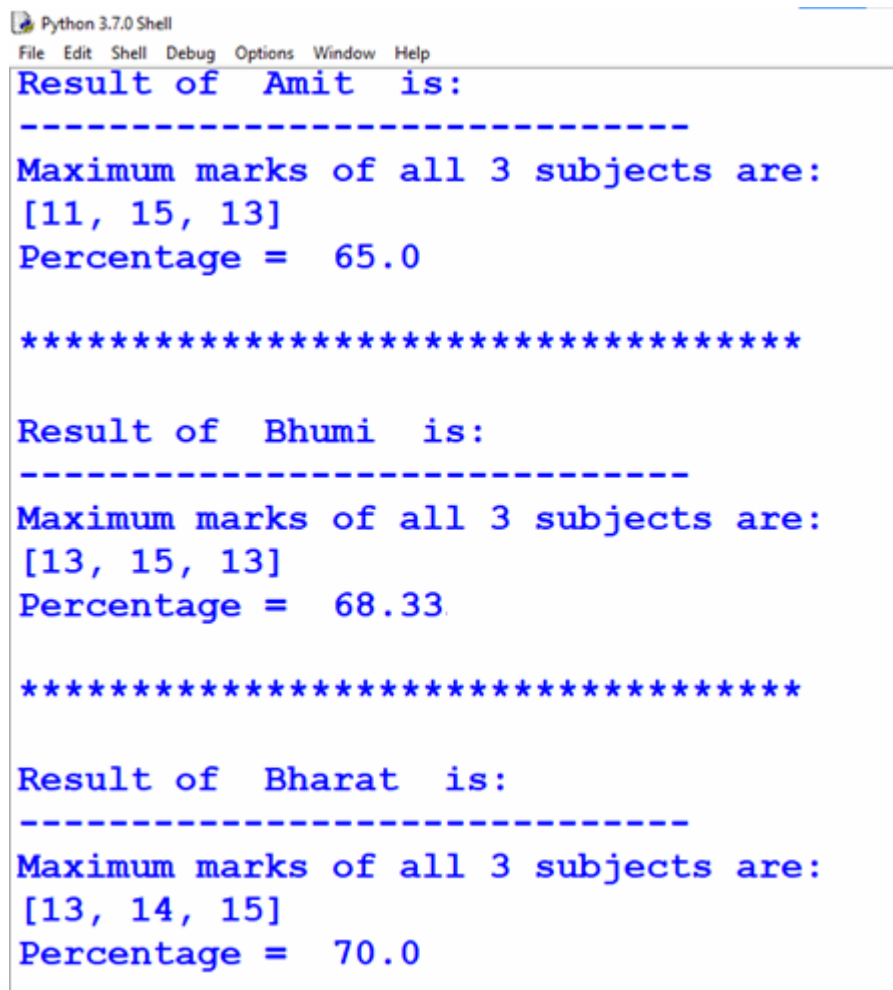

Write a python script to generate result for a particular student.

1. Create a student data in a dictionary object as shown below:

```
stud = {1: {"name": 'Amit', "age": 23, "marks": [(10, 15, 12), (11, 12, 13)]},
        2: {"name": 'Bhumi', "age": 22, "marks": [(13, 15, 11), (10, 10, 13)]},
        3: {"name": 'Bharat', "age": 23, "marks": [(12, 12, 14), (13, 14, 15)]}
}
```

NOTE: Here students are getting **marks of 3 subjects in 2 attempts** of test in a form of tuple

2. **Create separate user defined functions** to (Create a menu for options)
 - a. Take user input for creating entry of any new student (addStud())
 - b. Print all marks of a specific student. (Result(name))
 - c. Display overall result of all students in below given format (Report())

```
Python 3.7.0 Shell
File Edit Shell Debug Options Window Help
Result of Amit is:
-----
Maximum marks of all 3 subjects are:
[11, 15, 13]
Percentage = 65.0

*****

Result of Bhumi is:
-----
Maximum marks of all 3 subjects are:
[13, 15, 13]
Percentage = 68.33

*****

Result of Bharat is:
-----
Maximum marks of all 3 subjects are:
[13, 14, 15]
Percentage = 70.0
```

Inside the user defined function you can use any lambda or inbuilt methods / functions like map(), reduce() or filter()
