

1. Consider 2 lists, having random numbers between 1 and 50 in each list. Display the output as defined below: Create user defined functions for performing both the operations.
 - a. Display all the elements which are common in both the lists
 - b. Display only the elements which are present in list1 but not in list2
2. Create a list of 10 strings by taking user input. Separate the elements based on the length of the string.
3. Read the random lists from the text file where numbers are comma separated and one list in one line. Show the list in ascending order

Eg. unsorted list: 95 79 19 43 52 in 1st line of the file) Similarly many more unsorted list are there.

o/p : [19, 43, 52, 79, 95]

4. Consider the list of STATES that contains its Lok Sabha and Rajya Sabha seats as below:
{ "MP": (29, 11), "UP": (80, 31), "TN": (39, 18), "MH": (48, 19), "GJ": (26, 11), "RJ": (25, 10), "HP": (4, 3) }
Create a menu driven program to find following data. Create user defined functions
 - Total number of seats in all given states.
 - Display the list in descending order of their Lok Sabha seats.
 - States having Least number of Rajya Sabha Seats
