

Q1. Word Counter in a Sentence Write a Python program that: - Accepts a sentence from the user. - Create a python script to count the number of words in the sentence. - Check if a certain word exists in the sentence or not and display suitable message. Q2. Shopping Cart Billing System A shopkeeper wants a simple billing system. Write a Python program that: - Stores product prices in a dictionary (e.g., {"Apple": 50, "Banana": 20, "Mango": 30}). - Asks the user to enter products they want to buy with quantity. - Check if the entered product exists in the dictionary. - Write a script to calculate the total bill. Q3. Triangle Type Determination Write a Python program that: • Takes three side lengths of a triangle as input. • Uses conditional statements to classify the triangle as: o Equilateral (all sides equal) o Isosceles (two sides equal) o Scalene (all sides different) o Not a Triangle (if the sum of any two sides is not greater than the third side).
