

Q1. Scenario: You are working on a text-based analytics tool. You need to process a text file containing student's exam data, generate the result based on the specific criteria, and save the result.

Problem Statement:

1. Create a function `Exam_Process(filename)` that reads a file named `students_data.txt` (assume comma-separated: Roll#, Name, Marks1, Marks2....).
2. Inside the function, iterate through the list and use arithmetic operators to calculate the percentage score and result pass/ fail
3. If the marks is below 23/ 50, result is fail in that subject else pass
Finally, write the result data back to a new file named `result_students.txt`. In the below given format: Roll# , Name, Percentage, Result
4. Also display the result statistics as : Total number of students appeared in the exam, number of students "PASS" and No. of Students "FAIL"

Q2. Generate an **Inventory management system** using functions and file. Store and retrieve the product stock in the file only. Program must be a user friendly program that will take input from the user (store inventory manager) also
